

CERTIFICATE OF DURABILITY OF SYSTEMS B ZERO

This document certifies that, according to our experience, the treatment carried out with B Zero with a special machine it performs a permanent and definitive micronization, and do not alter the characteristics of the surfaces on which they are applied.

The system provides for a daily application of the B Zero "vapor" product using ultrasonic micronizers and cleaning of the surfaces with the B Zero "multipurpose" and d B Zero Floors cleaners.

These conditions will be achieved if the recommended cleaning procedures are carried out by adequately trained staff (B Zero System Service staff, cleaning company staff, etc.) or specially prepared staff trained by B Zero System.

Normal cleaning operations, carried out correctly in accordance with our procedures by hand or by machine, will not affect the duration of the treatment.

Cleaning procedures and daily micronization are predominant constraint on the system's durability.

The procedures shall be carried out exclusively by B Zero System.

B Zero System is not liable for all interventions executed outside the maintenance procedures.

Maintenance work carried out outside the procedures provided by B Zero System may affect the durability of the system.

The use of products that are not part of the maintenance procedure recommended by B Zero System must be authorized in writing by B Zero System, not because of the constraint on the use of our detergents but because some substances present in other products may affect and alter the protective treatment.

B Zero System will provide the use of special maintenance products on a case by case basis, in order to solve exceptional cases that may occur and are not attributable to B Zero System.

B Zero System may also inform the customer on how the surface is to be restored by the application of the restoration coating.
